**NEW**

**NEW** Dismountable Air Springs

**E**nidine Air Springs are highly durable, precisely engineered and cost-effective for use in a wide variety of actuation and vibration isolation applications. With time-tested designs, fabric-reinforced Wingprene™ or Natural Rubber flex member construction and corrosion-protected end retainers, Enidine Air Springs provide superior quality and performance.

As an actuator, Enidine Air Springs provide linear or angular motion. These Air Springs offer a favorable stroke-to-compressed-height ratio when compared to air cylinders, and can accept a wide variety of actuation media such as air, water, nitrogen or anti-freeze. As an isolator, Enidine Air Springs are effective in reducing the harmful effects of vibration. They can simultaneously isolate vibration and regulate load height, as well as allow for consistent vibration isolation under varying loads.

Enidine offers a variety of Air Spring types to meet your actuation or isolation needs. The Single, Double and Triple Convolute Bellows, Rolling Lobe and Sleeve Types are available in a wide range of sizes, with the End Retainer Style required for your installation.

In addition, Enidine is also pleased to present our new all-metric Dismountable Air Springs, available in Single, Double and Triple Convolute Bellows Types. Enidine Dismountable Air Spring products offer consistent operation in temperatures up to 115°C, and have optional metal parts available in stainless steel. This makes them ideal for use in harsh environments such as the food processing industry. All new Dismountable products feature the same low compressed height-to-stroke ratio and actuation properties as our standard product lines (see pages 21 & 22).

**Note:**

*Products are manufactured for Enidine by The Goodyear Tire & Rubber Company.*

The contents of this publication are the result of many years of research and experience gained in application technology. All information is given in good faith; it does not represent a guarantee with respect to characteristics and does not exempt the user from testing the suitability of products, including checking with respect to industrial property rights of any third parties. No liability whatsoever will be accepted for damage, regardless of its nature and its legal basis, arising from advice given in this publication. Products are subject to technical changes as a result of new developments.

**Temperature Range Guidelines**

Enidine Air Springs are constructed of either Natural Rubber or Neoprene "Wingprene™" elastomeric compounds. The temperature range guidelines for air spring applications vary depending on construction and nature of service.

**Continuous Service**

The maximum operating temperature for all Enidine Air Springs should not exceed 57°C. Continuous service is defined as operating 40 or more hours per week at this temperature. Minimum allowable operating temperature is -21°C for air spring products made with "Wingprene™", -49°C for products made with Natural Rubber.

**Intermittent Service**

The maximum allowable temperature should not exceed 65°C. Intermittent Service is defined as operating less than 40 hours per week at this temperature. Minimum allowable operating temperature is -40°C for products made with "Wingprene™" and -60°C for products made with Natural Rubber. Note that minor cracking may occur with any prolonged operation at these minimum temperatures.

**Technical Data Note:**

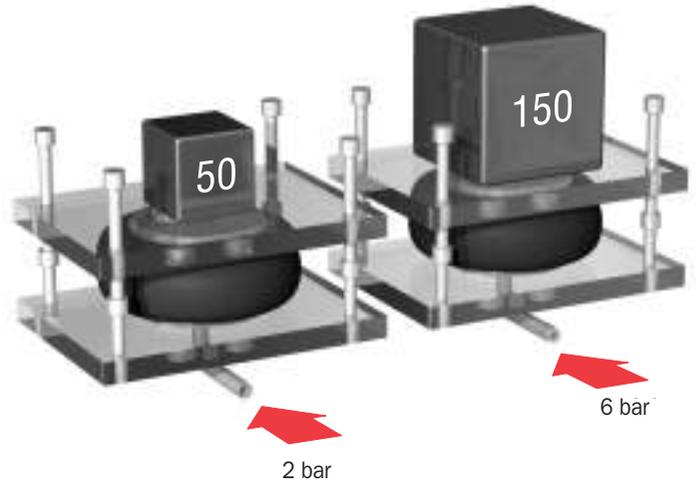

*Metric values detailed in the Imperial product section are converted from their original Imperial form using standard conversion formulas. Values detailed in the Metric products section are actual figures.*

## Advantages of Enidine Air Springs

### Simple construction.

Varying loads can be supported by one Air Spring size. Therefore, no re-design is necessary for varying loads.

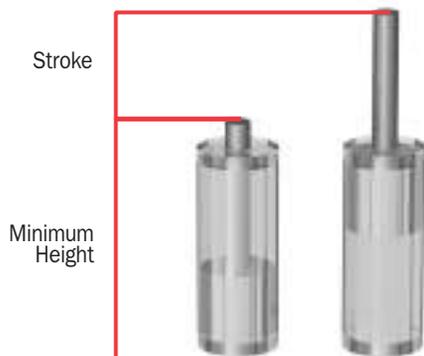

### Max. displacement 10mm.

Displacement permissible between upper and lower end plate. Therefore, no costly machining of mounting holes is necessary.

### Little space required, no sealing required.

Compared to conventional pneumatic cylinders, the minimum height of the Enidine Air Spring is significantly lower at the same stroke.

## Standard Materials

Flex Members: Fabric-reinforced Wingprene™  
Fabric-reinforced natural rubber

End Retainers: Forged steel  
Cast zinc alloy  
Cast aluminum

## Operating Temperature Range

Fabric - reinforced Wingprene™: -40°C to 65°C  
(-40°F to 150°F)

Fabric - reinforced Natural Rubber: -60°C to 65°C  
(-76°F to 150°F)

## Environmental Considerations

Good for most industrial applications. Can be affected by certain chemicals. Contact Enidine or your Local Representative for specific information.

## Ordering Information

### EXAMPLE:

**100**                      **YI-1B6**                      -                      **535**

1. Select Quantity                      2. Select Product Description Number from Selection Chart                      3. Select Assembly Number from Selection Chart

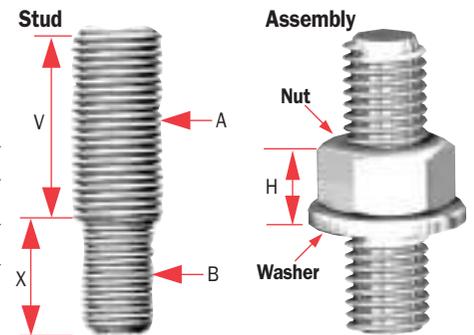

Model Number

\*Note: Allowable working temperature range varies. See temperature range guidelines for details.

## Accessories

### Assembly (Stud + Nut + Washer)

Part Number	A	B	H		V		X

### Tank Valve Including Safety Cap

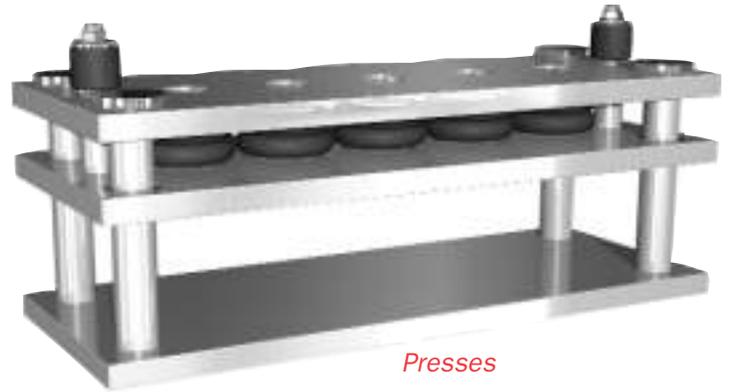

## Typical Applications for Actuation

### Scissor Lifts

- Scissor lifts
- Injection or ejection of parts in manufacturing equipment
- Vertical lift force for platforms and rotating tables
- Conveyor or transfer systems
- Rotary shaft actuators

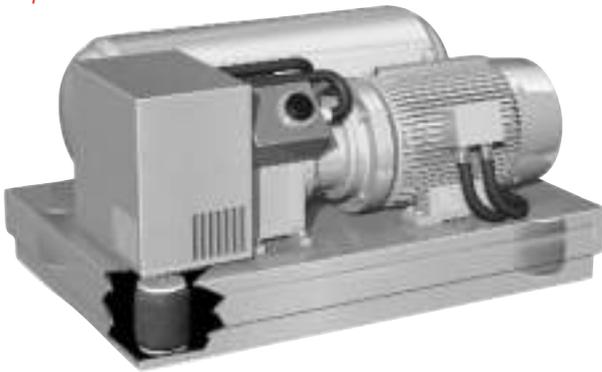

- Presses
- Bin-tilting devices
- Palletizers, label applicators in packaging equipment
- Amusement park rides
- Clutch and brake systems

Presses

## Typical Applications for Vibration Isolation

### Compressors

- Vibratory conveyors
- Large drying machines
- Centrifugal separators
- Coordinate measuring tables and machinery
- Commercial laundry machines

- Textile looms
- Conveyor loading points
- Compressors
- Electronic equipment

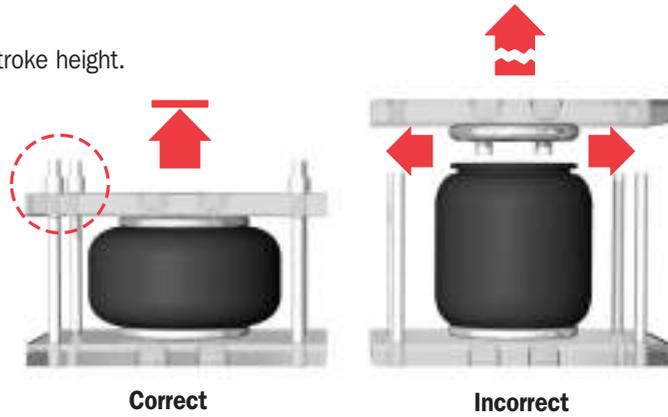

Electronic Equipment

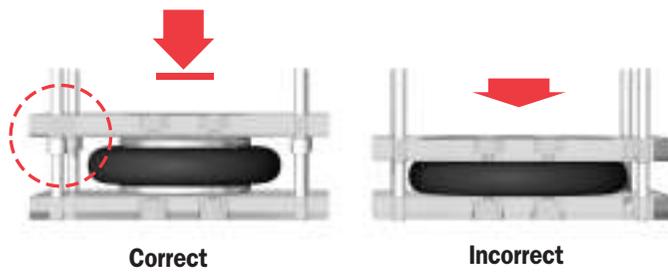

## Installation and Operating Instructions

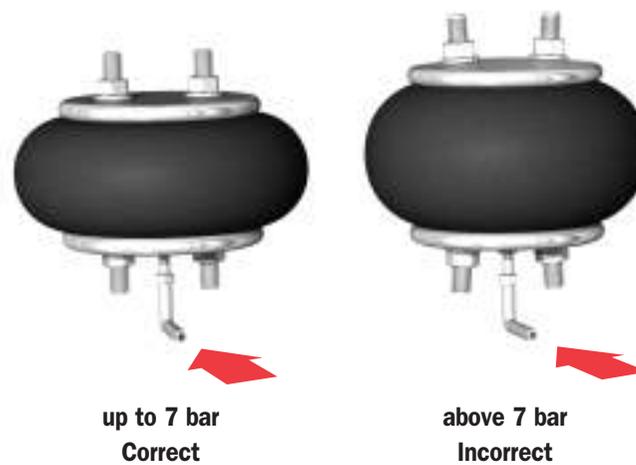

Provide stroke limitations, to prevent exceeding the maximum allowable stroke height.

Provide stops for minimal height, or use Air Springs with Internal Bumper.

Max. allowable pressure: 7 bar.

Do not use Air Springs in torsion.

## Selecting an Enidine Air Spring for Actuation

### Application Worksheet: Actuation

The following data should be given:	Symbol	Unit	Calculation:	
1. Total force required for actuation	$F_t$	_____ lbs. (N)	Force per Air Spring	Example:
2. Number of actuators	$n$	_____	$F = \frac{F_t}{n}$ lbs.	$F_t = 4\ 200$ lbs. (18 682 N)
3. Stroke required	$s$	_____ in. (mm)		$n = 4$
4. Available air pressure at the point of installation	$p$	_____ psi (bar)		$F = \frac{4\ 200\ \text{lbs.}}{4}$
5. Working temperature range**	$t$	_____ °F (°C)		$F = 1\ 050$ lbs. (4 671 N)
6. An internal bumper will be required if any of the following conditions occur: <ul style="list-style-type: none"> <li>External compression stops are not provided</li> <li>Severe impacting at the compressed height of the Air Spring.                             <ul style="list-style-type: none"> <li><input type="checkbox"/> Internal Bumper</li> <li><input type="checkbox"/> No Bumper</li> </ul> </li> </ul>				Example:
7. Is a constant actuation force required for this application?		<input type="checkbox"/> Yes - only Sleeve and Rolling Lobe Type Air Springs <input type="checkbox"/> No - all type Air Springs <input type="checkbox"/> Yes	Corrected Force [ $F_c$ ]:*	$p = 50$ psi (3,5 bar)
8. Metric version		<input type="checkbox"/> Yes	$F_c = \frac{F \times 100\ \text{psi}}{p}$ ***	$F_c = \frac{1\ 050 \times 100}{50}$
			$F_c =$ _____ lbs.	$F_c = 2\ 100$ lbs. (9 341 N)

\* All Force values in the Selection Chart are based on a maximum operating pressure of 100 psi (7 bar). \*\*\* Actual force capabilities of the Air Spring depend on the air pressure available. The Corrected Force calculation compensates for available air pressure.

\*\* Working Temperature Range for Sleeve Type and Bellows Type YI-1B5, YI-1B6, YI-1B7, YI-1B8; YI-2B6, YI-2B7 and YI-2B8 is 40°C to 100°C (-40°F to 210°F). Working Temperature Range for all other Air Springs is 55°C to 70°C (-65°F to 160°F).

\*\*\* 8 bar (114 psi) for Dismountable Air Springs.

### Sizing Instructions

**Step 1:** Fill out the Application Worksheet.

**Step 2:** In most applications, a constant actuation force over the stroke is not required and sizing should begin with Single Convolute Bellows Type Air Springs. However, if a constant actuation force over the stroke is required, consider only the Sleeve and Rolling Lobe Type Air Springs.

**Step 3:** Refer to the Selection Chart under *Actuation Specifications*. In the *Force (lbs.) At A Stroke Of: Data Table* choose the column that is equal to or exceeds the Stroke Required (S) (i.e., if a stroke of 2,5 in. "[64mm]" is required, refer to the 3,0 in. "[75mm]" column). Identify the first Air Spring model that will generate a force equal to or greater than the Corrected Force ( $F_c$ ) required. This is the Enidine Air Spring that will best serve your application. Select a model that includes an internal bumper if one is needed in the application. Availability of internal bumpers can be found under the *Features* table for each Air Spring.

**Step 4:** Verify the *Envelope Dimensions* of the selected Enidine Air Spring to ensure that the Air Spring will fit the application. Allow a 2 in. (50mm) clearance on the diameter to prevent abrasion of the flex member. Select the *Model Number* that provides the *Features* and *Mounting Dimensions* required for the application.

### Installation Considerations

- External extension stops are required to limit the extension of the Air Spring(s).
- The path of motion must be guided, as Air Springs provide little lateral stability.

### Sizing Example

A 3 100 lb. (13 789 N) conveyor carrying an 1 100 lb. (4 893 N) package needs to be lifted 1,8 in. (46mm) to transfer the package to another conveyor. There will be four Actuators utilized and the warehouse has air lines with 50 psi (3,5 bar). A constant actuation force is not required. Ambient temperature is 68°F (20°C). There is a 12 in. (305mm) square space to house each Air Spring. Compression and extension stops are provided. Any *Air Fitting Port* and *End Retainer Style* would be acceptable.

**Step 1:** From the completed Application Worksheet, we know:

- Corrected force per actuator is 2 100 lbs. (9 341 N)
- Stroke required is 1,8 inches (46mm)
- An internal bumper is not required
- A constant actuation force is not required
- Working temperature is 68°F (20°C)

**Step 2:** A constant force is not needed. Therefore, all Air Spring types are considered, beginning with Single Convolute Bellows.

**Step 3:** In the 2,0 in. (50mm) column under the *Force lbs. [N] At A Stroke Of: Data Table*, identify an Air Spring that can generate 2 100 lbs. (9 341 N) of force. No internal bumper is required. Model YI-1B6-535 is selected (metric model YI-1B6-835 is selected).

**Step 4:** The maximum diameter of a YI-1B6-535 is 7 in. (metric model YI-1B6-835 has 178mm diameter). Therefore, we need a 9 in. (228mm) diameter space to house the Air Spring. A 12 in. (305mm) square space will easily house the Air Spring. Any *Air Fitting Port* and *End Retainer Style* would be acceptable. Model YI-1B6-535 is selected (or metric model YI-1B6-835 is selected).

## Selecting an Enidine Air Spring for Vibration Isolation

### Application Worksheet: Vibration Isolation

The following data should be given:	Symbol	Unit	Calculation:
1. Total load	$W_t$	_____ lbs. (N)	<b>Load per Air Spring:</b> $W = \frac{W_t}{n} =$ <div style="display: flex; justify-content: space-between; width: 100%;"> <span>lbs</span> <span>Example: <math>W_t = 8\,500</math> lbs. (37 810 N) <math>n = 4</math> <math>W = \frac{8500}{4}</math> <math>W = 2\,125</math> lbs. (9 452 N)</span> </div>
2. Number of isolators	$n$	_____	
3. Input excitation frequency	$f_i$	CPM or RPM/60 = Hz _____ Hz	<b>Corrected Load [<math>W_c</math>]:</b> $W_c = \frac{W \times 100 \text{ psi}^{***}}{p}$ <div style="display: flex; justify-content: space-between; width: 100%;"> <span>lbs.</span> <span>Example: <math>p = 100</math> psi (7 bar) <math>W_c = \frac{2\,125 \times 100}{100}</math> <math>W_c = 2\,125</math> lbs (9 452 N)</span> </div>
4. Available air pressure at the point of Installation	$p$	_____ psi (bar)***	
5. Working temperature range	$t$	_____ °F (°C)**	
6. Required isolation	$I$	<input type="checkbox"/> 80 % <input type="checkbox"/> 90 %	
7. An internal bumper will be required if any of the following conditions occur: <small>- External compression stops are not provided.            - Severe impacting at the compressed height of the Air Spring.            - Operation of vibrating equipment on a deflated Air Spring.</small>		<input type="checkbox"/> Internal Bumper <input type="checkbox"/> No Bumper	
8. Metric version		<input type="checkbox"/> Yes	

\* All Load values in the Selection Charts are based on a maximum operating pressure of 100 psi (7 bar)\*\*\*. Actual load bearing capabilities of the Air Spring depend on the air pressure available. The Corrected Load calculation compensates for available air pressure.  
 \*\* Working Temperature Range for Sleeve Type and Bellows Type YI-1B5, YI-1B6, YI-1B7, YI-1B8; YI-2B6, YI-2B7, YI-2B8 is -40°F to 210°F (-40°C to 100°C). Working Temperature Range for all other Air Springs is -65°F to 160°F (-55°C to 70°C).  
 \*\*\* If no air lines are available, a tank valve should be utilized; use 100 psi (7 bar)\*\*\* to select an Air Spring.  
 \*\*\* 8 bar (114 psi) for Dismountable Air Springs.

### Sizing Example

Vibrations generated by a pump weighing 8 500 lbs. (37 810 N) and rotating at 600 RPM are being transmitted onto sensitive monitors, causing them to malfunction. To control these damaging vibrations, four Isolators – located symmetrically about the center of gravity – will be used. The ambient temperature range is 60°F to 140°F (16°C to 60°C). Air lines are not available at the site. Therefore, a tank valve will be used. There is the possibility of depressurization of the Air Spring. An isolation of greater than 90% is required. There is a 9 in. (228mm) diameter space to house the Air Spring. Any *Air Fitting Port* and *End Retainer Style* would be acceptable.

**Step 1:** From the completed Application Worksheet, we know:

- Load per isolator is 2 125 lbs. (9 452 N)
- Because a tank valve is being utilized, size using 100 psi (7 bar)
- Corrected load per isolator is 2 125 lbs. (9 452 N)
- Working temperature range is 60°F to 140°F (16°C to 60°C)
- Because of the possibility of depressurization, an internal bumper is required
- Input excitation frequency is 600 CPM

**Step 2:** The first Enidine Imperial Air Spring model that has an internal bumper and is capable of supporting the Corrected Load Per Isolator is the YI-1B6-538. This Air Spring provides 90% isolation at 435 CPM and 97,4% at 870 CPM. Therefore, at 600 CPM, the percent isolation is estimated to be 94%.

**Step 3:** The maximum diameter of a YI-1B6-538 is 7 in. (178mm). Therefore, we need a 9-in. (228mm) diameter space to house the Air Spring. A 9-in. (228mm) diameter is available. Any *Air Fitting Port* and *End Retainer Style* would be acceptable. Imperial Model YI-1B6-538 is selected. Metric model YI-1B6-835 is selected.

(Note: this model has no internal bumper, therefore external endstops must also be used.)

### Sizing Instructions

**Step 1:** Fill out the Application Worksheet.

**Step 2:** Refer to the Selection Chart under *Isolation Specifications*. In the *Isolator Load Range @ 100 psi (7 bar)\*\*\** column, identify the first Air Spring model that will support the Corrected Load ( $W_c$ ) required for the application. Check the Data Table for *Percent Isolation at an Input Frequency Of:* and compare the Input Excitation Frequency ( $f_i$ ) to the input frequencies listed. Referring to the percent isolation for the model identified, estimate the approximate percent of isolation. If the first model identified does not meet the isolation requirements, then select the model that will **both** support the Corrected Load ( $W_c$ ) and provide the required percent of isolation. Select a model that includes an internal bumper, if one is needed in the application. Availability of internal bumpers can be found under the *Features* Table for each Air Spring.

**Step 3:** Verify the *Envelope Dimensions* of the selected Air Spring to ensure that the Air Spring will fit the application. Allow a 2 in. clearance on the diameter to prevent abrasion of the flex member. Select the *Model Number* that provides the *Features* and *Mounting Dimensions* required for the application.

### Installation Considerations

- To ensure stability, the distance from the floor to the center of gravity of the load should not exceed the shortest distance between Air Springs.
- Air Springs provide little lateral stability. Therefore, be sure to include a method of stabilization.
- Pressurize the Air Spring only when it is loaded.

## End Retainer Styles

\* Listed strokes start from the compressed height of the Air Spring.  
 \*\* This range is based on 7 bar; to obtain the lower limit (i.e., minimum load @ 1,4 bar) divide the smaller value by 5.  
 \*\*\* In the "Isolation Specification" section, there is a column titled: "% Isolation At Input Frequency." The figures in this column reflect the approximate percentage of isolation obtainable, if the design height is at the center of the design height range, and the load per air spring is within the isolator load range. If the design height is above or below the design height range, vibration isolation may be slightly higher or lower, respectively.

## End Retainer Styles

\* Listed strokes start from the compressed height of the Air Spring.

\*\* This range is based on 100 psi (7 bar); to obtain the lower limit (i.e., minimum load @ 20 psi), divide the smaller value by 5.

\*\*\* In the "Isolation Specification" section, there is a column titled: "% Isolation At Input Frequency." The figures in this column reflect the approximate percentage of isolation obtainable, if the design height is at the center of the design height range, and the load per air spring is within the isolator load range. If the design height is above or below the design height range, vibration isolation may be slightly higher or lower, respectively.

Note: For values other than 100 psi (7 bar), consult factory.

Lower End Retainer identical minus Air Fitting Port

**STYLE 4**

**Upper End Retainer**

Lower End Retainer identical minus Air Fitting Port

\* Listed strokes start from the compressed height of the Air Spring.

\*\* This range is based on 100 psi (7 bar); to obtain the lower limit (i.e., minimum load @ 20 psi) divide the smaller value by 5.

\*\*\* In the "Isolation Specification" section, there is a column titled: "% Isolation At Input Frequency." The figures in this column reflect the approximate percentage of isolation obtainable if, the design height is at the center of the design height range, and the load per air spring is within the isolator load range. If the design height is above or below the design height range, vibration isolation may be slightly higher or lower, respectively.

Note: For values other than 100 psi (7 bar), consult factory.
